APM case study · Armut / ProntoPro · November 2026

Making event services visible

An occasion entry that groups existing services and sends each one into today's request flow.

Ahmet Tunay Çelik

How I worked

Walked it

3 sites (Armut, ProntoPro, Homerun) × 3 entry points from the brief

Real wedding-photographer requests to the end; 2 real quotes back

Read the data

Public price pages with real past requests

Pro pages with yearly request counts

Benchmarks: Thumbtack, Düğün.com, The Knot, Getir

Worked with an AI team

Claude agents: researchers, event & supply experts, engineer, analyst, UX, fact checker, red-team critic, review panel

I set direction and constraints and chose the solution

Numbers are public-page estimates or small samples. Time above the 2-3 h guide, mostly verification and waiting for real quotes. AI transcript shared.

Goal and constraint

Goal: more requests in event services (wedding photographer, birthday cake, bridal make-up and similar).

Team: 1 backend, 1 frontend, 1 UX designer.

My constraint: no change to the shared request flow or pricing (range shown, pro sets the price). Both affect every category, so solutions are event-specific layers on top.

Scope: Armut (TR), ProntoPro (IT), Homerun (UK) share flow and templates: one build, three markets.

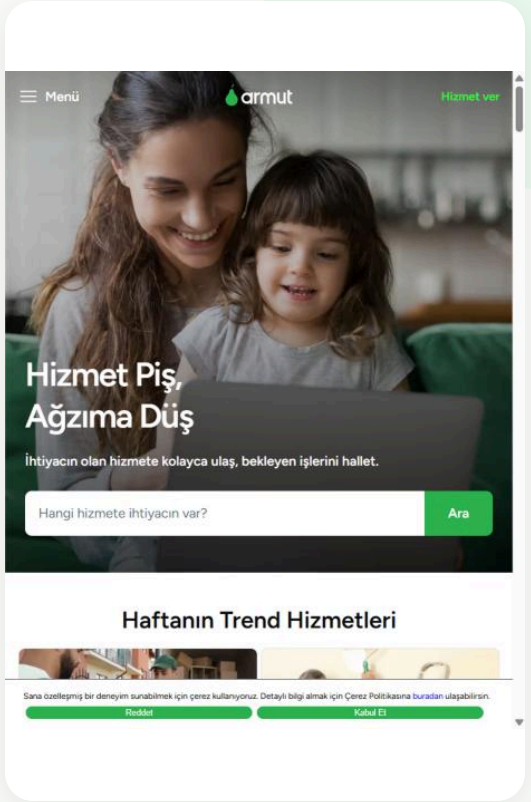

Homepage search: people find events only if they already know to ask

0 of 36

services on Armut's homepage lists are event services. The search box's suggestions show moving, painting, cleaning.

Typed search works: "kına" → Kına Organizasyon, Kına Mekanları.

ProntoPro shows one event service in trending. Homerun none.

So what: demand is not missing, the door is. We only show events to people who already know to ask.

Campaign page and listing: thin trust where buyers compare

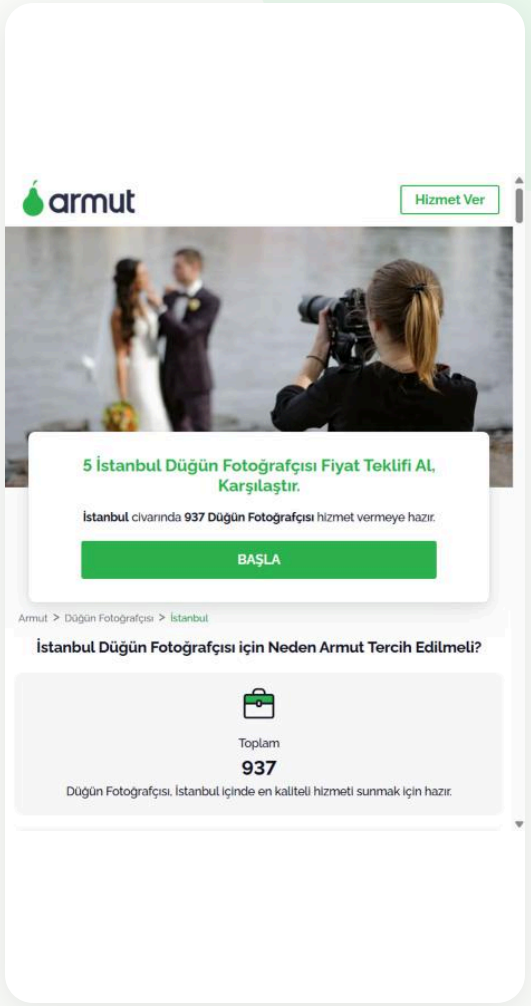

Campaign page: one "Başla" button, no price, no pro work, masked review names.

Local list: profiles from 2015-2017, off-topic bios.

Same template on all three sites.

Event buyers come from Instagram, where they see portfolios.

Events are bundles, sold one by one

44%

of nişan organization requests also mention tables and chairs (music 19%). Birthday organization: tables 21%, clown 17%. Cake: 6-8%.

No site groups services by occasion. After a request, nobody suggests the next service.

Armut price-page samples (Armut chooses which ones are shown)

So what: customers think in occasions; we sell single services. The next service is the cheapest request we can get.

Low reach, not low need (hypothesis)

Turkey

~0.5%

wedding photographer requests vs marriages (2,947 / ~552k)

Italy

~1.8%

(3,321 / ~180k). Catering 19,300 and DJ 5,717 vs moving 7,832

Armut: ~108k event customers a year, mostly small, home-hosted and near-date (civil ceremony, kına, "Mi sposerò questo venerdì!").

Supply is not the limit: ~937 Istanbul photographers, ~1-2 requests each a year.

So what: the same platform reaches ~3x more of the market in Italy. Turkey looks like a reach problem.

Problem

Event services are invisible on our own surfaces, and they are sold one by one while customers think in occasions.

How might we let someone planning an occasion see everything they need in one place, without changing the request flow?

Options I weighed

Option	Score /25	Decision
After-request "what happens next" + next-service card	22	Runs alongside (only reaches people who already asked)
Occasion entry + grouped occasion page	21	**Main bet: the only option that reaches new event demand**
Campaign headline copy test	20	Cheap side test
SEO price and local page upgrade	19	Next
"Found on Armut/ProntoPro" creator program	12	Later, with marketing

Dropped: price or work before the request, changes to the flow, event messages to cleaning/moving customers (0 of 315 mention events).

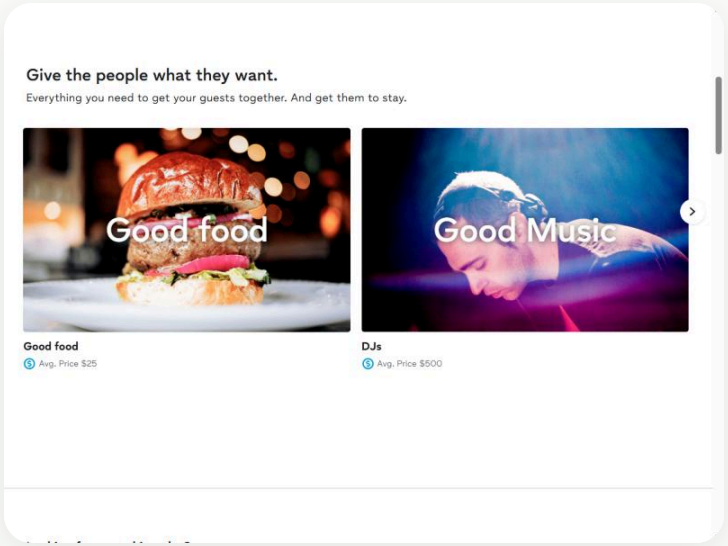

Why the 21 beats the 22: the card only reaches people already asking. The occasion entry is the one option that creates new event demand.

Inspiration: copy the page, not the basket

Grocery recipes (Migros "Ne pişirsem?", Instacart shoppable recipes; Getir tried a similar idea): everything for one dinner on one page.

Thumbtack Events, Düğün.com, The Knot, Bridebook: services grouped by occasion, one quote per service.

No service site has a "request all" button: each service has its own quotes, pros and timing.

Lesson: start from the occasion, show everything on one page, but keep one request per service. Pros pay per quote, so a "request all" button would create weak leads.

The solution: one occasion page, four ways in

Homepage

Tiles: "Evleniyor musun?", "Nişan / kına", "Doğum günü" (IT "Ti sposi?", UK "Getting married?")

Search

"Özel günler" block in the suggestions

Campaign & listing

"Bu gün için diğer hizmetler" block

After a request

"Nişanın için diğer hizmetler" link

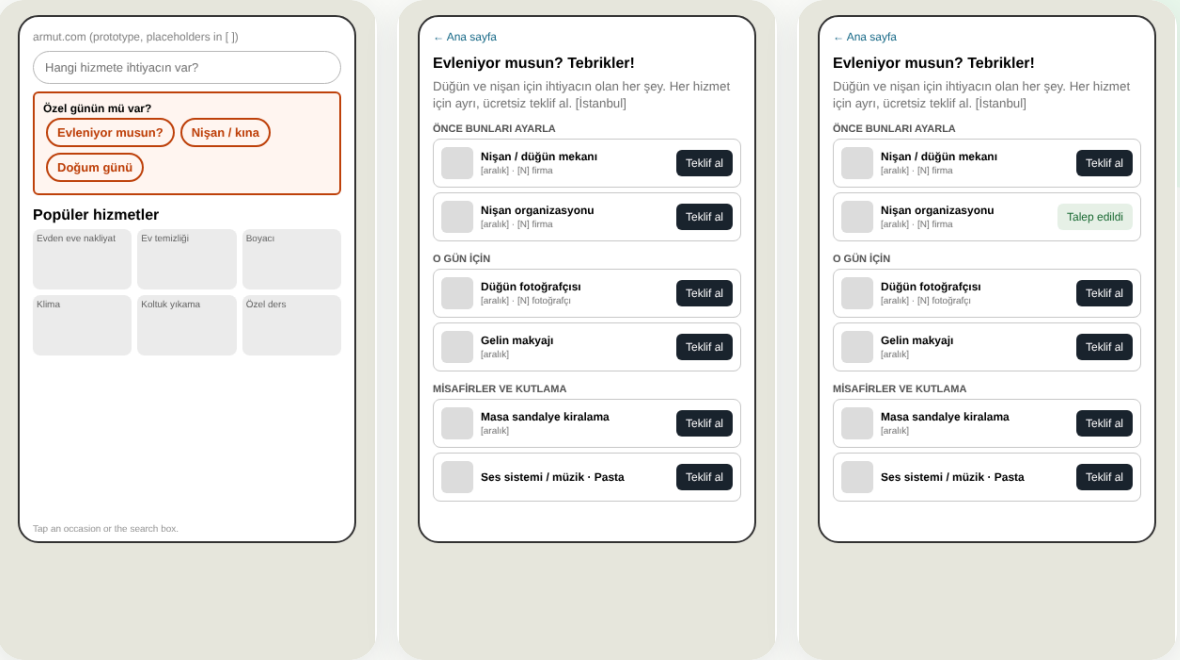

Occasion page: grouped services, price range and pro count already on the site, one "Teklif al" per service into its existing flow, "Talep edildi" on services already requested. No basket.

Prototype

Clickable mobile prototype: homepage tile → occasion page → existing request flow → after-request screen.

Design options: **A** grouped page (chosen); **B** checklist ticks, closest to Getir (later: 3 ticks = 3 full flows); **C** timeline (later: most requests are near-date).

What I need to know, and how

Event funnel by entry point and market	Product analytics
How often event words are searched	Search logs, Search Console
Co-need across all requests	Request data, then the after-request card
Event requests with 0 quotes in 48 h, by city	Marketplace data (where to launch)
Seasonality	Requests by month
Why buyers choose Instagram or leave	8-10 customer interviews
Do pros want more requests at this fee?	Pro survey, quote rates

First pull: 0-quote share by city. It decides where we can safely send more demand.

Test and success

Where: İstanbul, Ankara, İzmir + one Italian city, only where pros answer within 48 h; before wedding season.

Arms: control / tile → occasion page / tile → search block. **4 weeks.**

Primary: submitted event requests per visitor

Quality: event requests with 1+ quote in 48 h

Guardrail: total requests per visitor (+ long-term holdout)

Kill rule: 0-quote share > control + 5 pts

Sizing, not forecast: roughly 1-2 thousand extra event requests a year per market. The test decides.

Risks and next steps

Risks

- Homepage space taken from core → guardrail + holdout
- Weak requests cost pros → quote-based quality metric, supply-gated cities
- Buyers start on Instagram

Next

- After-request card (runs alongside)
- "Found on Armut/ProntoPro" creator pilot linking to the occasion page
- SEO price pages, copy test, trust card

Appendix: assumptions, data, platform evidence, AI transcript

In one sentence

Event demand is real (~108k event customers a year on Armut, 17-44% of organization requests ask for a second service) but our homepage, search and listings never show it.

I would test one occasion entry that groups existing services and sends each one into today's request flow.

Built for a team of three, in weeks, for all markets.

Appendix

- Assumptions and how I would validate them: low reach vs low need, co-need beyond samples, supply absorbs more requests
- Data sources: Armut and ProntoPro price pages and pro pages (checked 7-8 Nov 2026), TÜİK marriages via DHA, İSFO via Milliyet
- Platform evidence: consecutive request IDs and one shared account across the three sites (inference)
- Design options A/B/C: wireframe/occasion-hub-designs.html
- AI conversation: [link / transcript]
