APM case study · Armut / ProntoPro · November 2026

# Making event services easy to find

One page per occasion, so someone planning a wedding or a birthday sees everything we offer in one place.

Ahmet Tunay Çelik

# How I worked

### I used the product

I went through all three starting points on Armut, ProntoPro and Homerun and sent real wedding-photographer requests. Two real quotes came back.

### I read the public data

The sites' own price pages show real past requests, and their pro pages show how many requests each service gets a year. I compared them with Thumbtack, Düğün.com and The Knot.

### I worked with an AI team

Claude agents helped me research, challenge my ideas and review the case. I set the direction and made the decisions.

The numbers are estimates from public pages and small samples, so I mark where each one comes from. I spent more than the suggested 2-3 hours, mostly checking facts and waiting for real quotes.

# The goal, and what I kept fixed

The goal is simple: more requests for event services like wedding photographers, birthday cakes and bridal make-up, with a team of one backend developer, one frontend developer and one designer.

I kept the request flow and the pricing exactly as they are, because both are shared by every category. So everything I suggest sits on top of today's product.

Armut, ProntoPro and Homerun share the same flow and page templates, so one build can serve all three markets.

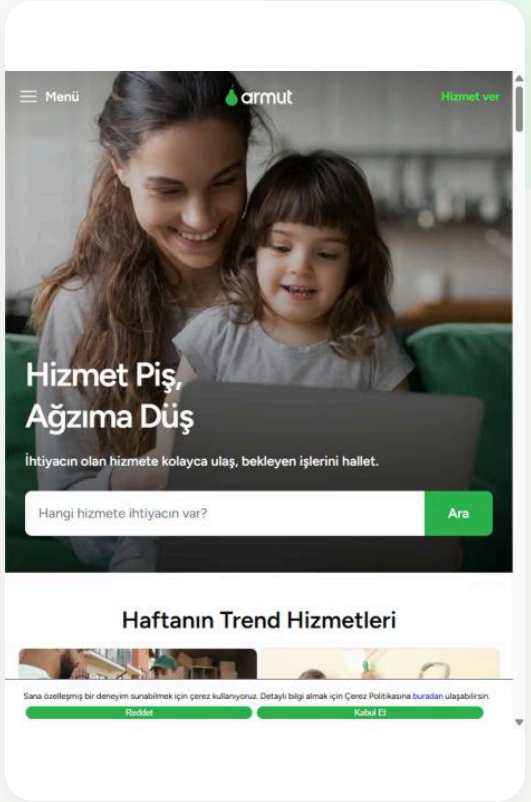

# On the homepage, events are hard to find

## 0 of 36

None of the 36 services on Armut's homepage is an event service, and the search box only suggests things like moving and cleaning.

Search itself works well. Type "kına" and you get kına organizers and venues. But you only type it if you already know Armut does events.

ProntoPro shows one event service on its homepage, Homerun none. (Checked on the live sites, 7 Nov 2026.)

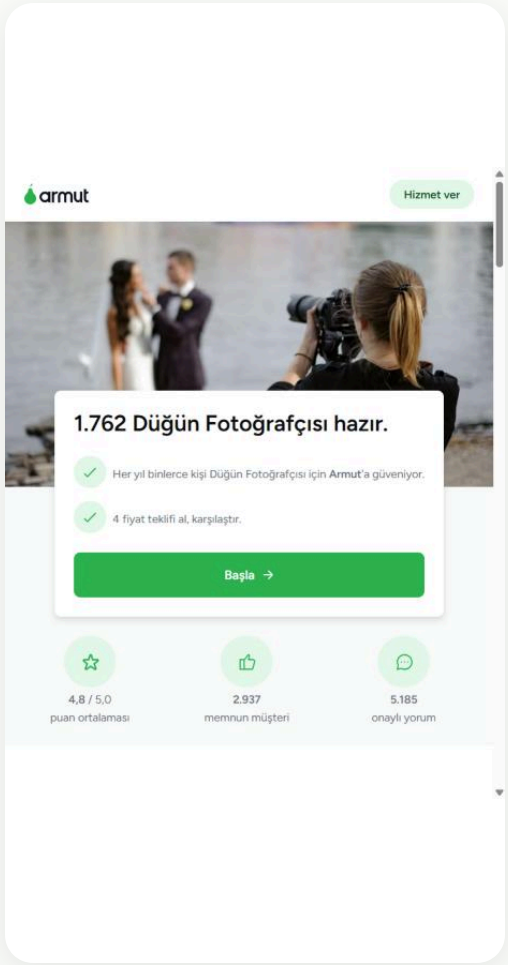

**So what:** the demand is there, but the door is hidden.

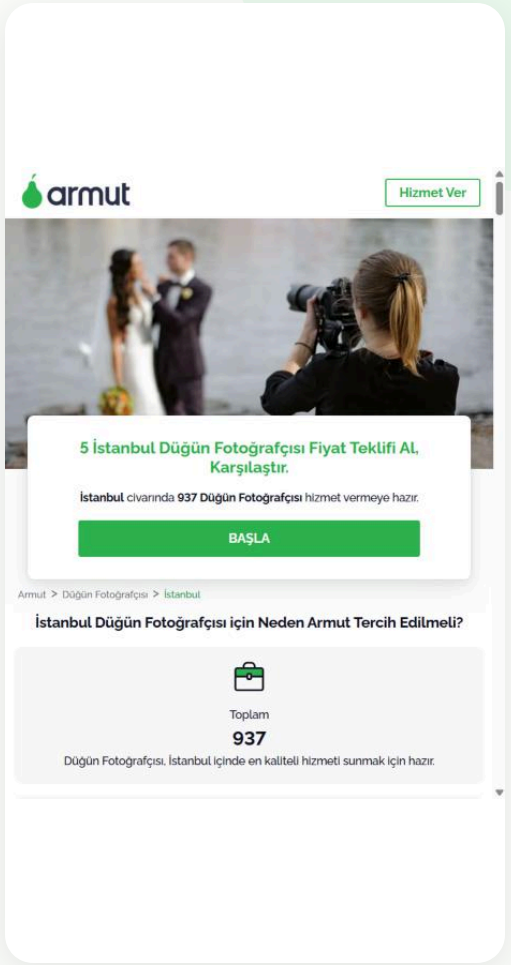

# Service pages don't build much trust

The campaign page has one button, no photos of real work and hidden reviewer names. The local list still shows profiles from 2015-2017 and some that have nothing to do with weddings.

It's the same on all three sites.

This matters for events, because people usually choose a photographer or a cake maker by looking at their Instagram.

# People plan occasions, but we sell one service at a time

**44%**

of nişan organization requests also ask about tables and chairs, and many birthday requests mention a clown or tables too, according to real requests on Armut's price pages.

Yet no site groups services by occasion, and after a request nothing suggests what else you might need.

**So what:** the next service someone needs is the easiest request we can win.

# The need is there, the reach isn't (my hypothesis)

**Turkey**

**~0.5%**

of weddings lead to a photographer request on Armut (2,947 a year on Armut's pro page vs ~552k marriages, TÜİK)

**Italy**

**~1.8%**

on ProntoPro (3,321 a year vs ~180k marriages)

Armut already has around 108,000 event customers a year by its own page counts. Most events are small, close and often at home.

And there are plenty of pros: about 937 wedding photographers are listed in Istanbul.

**So what:** the same platform reaches about three times more of the market in Italy.

# The problem

Our event services are hard to find, and we sell them one by one while people think in occasions.

**How might we** show someone planning an occasion everything they need in one place, without changing how requests work?

# The options I looked at

| Option | Score /25 | What I'd do |
|---|---|---|
| Suggest the next service after a request | 22 | Run it alongside |
| **Occasion pages, reached from the homepage and search** | 21 | **Main bet** |
| Test new headlines on campaign pages | 20 | Quick side test |
| Improve the price and city pages for search | 19 | Next |
| Creators sharing "found on Armut/ProntoPro" | 12 | Later, with marketing |

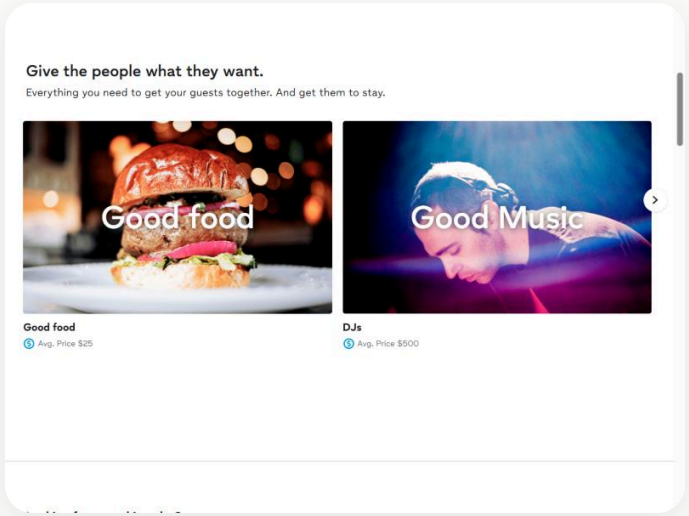

Scores come from a review panel I ran with the AI team: impact, confidence, effort, fit and risk.

**Why not the top score?** Suggesting the next service only reaches people who already asked. Occasion pages are the only option that brings in new event demand.

# The idea comes from groceries, but I'd copy the page, not the basket

Grocery apps like Migros and Instacart show a recipe with all its ingredients on one page. Getir tried a similar idea.

Service sites like Thumbtack, Düğün.com and The Knot do the same for events: they group services by occasion. But each service still gets its own quote, because each one has its own pros and timing.

**Lesson:** start from the occasion and keep one request per service. Pros pay per quote, so a "request everything" button would only bring them weak leads.

# The solution: one page per occasion, easy to reach

### Homepage

"Evleniyor musun?", "Nişan / kına", "Doğum günü" (and "Ti sposi?", "Getting married?")

### Search

A "Special days" block in the suggestions

### Service pages

"Other services for this day" on campaign and city pages

### After a request

A link to the rest of the occasion

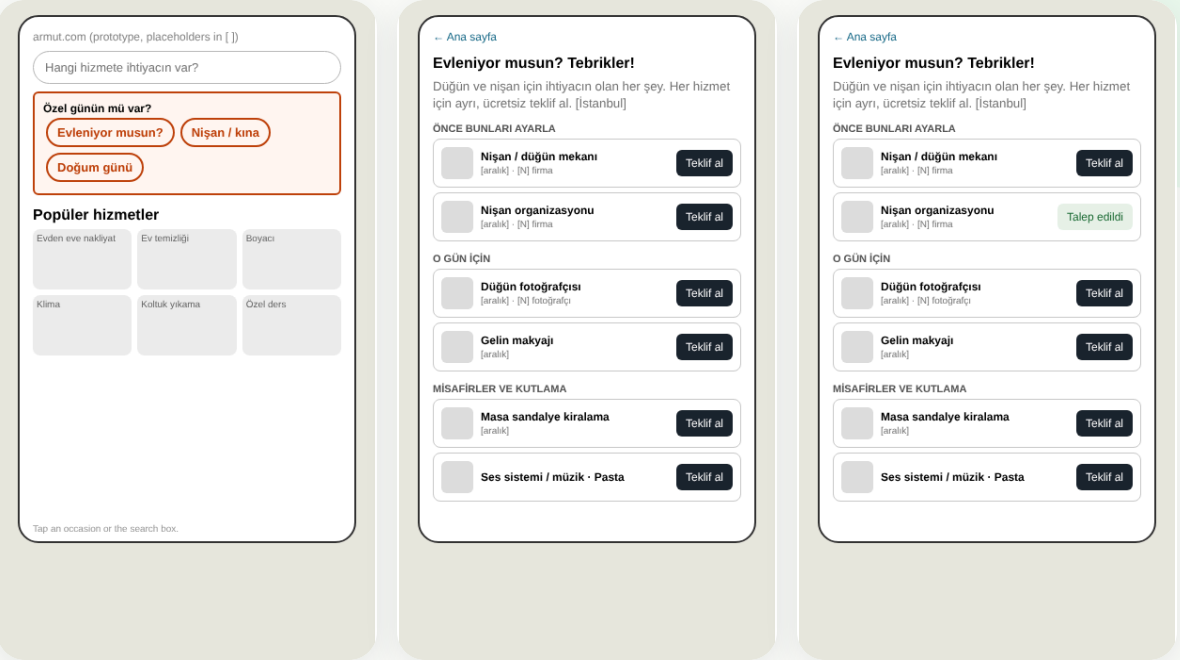

Each occasion page groups the services with their usual price range and number of pros. Every service has its own "Teklif al" button that opens today's request form, and services you've already asked for are marked.

# Prototype

Tap an occasion on the homepage, see everything for it on one page, ask for quotes as usual, and come back to see what you've already requested.

I also sketched two other versions: a checklist like Getir's, and a timeline of what to book when. I'd keep both for later, because most of our requests are small and close to the date.

Prototype:
github.com/AhmetTunayCelik/Armut/blob/main/deck/prototype.html

# What I'd want to know, and where I'd look

| | |
|---|---|
| Where event requests start, and where people drop off | Product analytics |
| How often people search for event words | Search logs |
| Which services people need together | Request data |
| Which cities answer event requests quickly | Quote data |
| When the busy season starts | Requests by month |
| Why people pick Instagram instead | 8-10 short interviews |
| Whether pros want more event requests | A quick pro survey |

**First question:** in which cities do event requests get quotes fast? That's where we can safely send more people.

# How I'd test it

I'd start in Istanbul, Ankara and İzmir plus one Italian city, only where pros reply within 48 hours, and before wedding season.

For four weeks, some visitors see today's homepage, some get the occasion page, and some get the occasion block in search.

**Success:** more event requests per visitor

**Quality:** those requests get a quote within 48 hours

**Safety check:** total requests don't drop

**Stop if:** event requests start going unanswered

My rough guess is one or two thousand extra event requests a year per market, but that's a sizing, not a forecast. The test decides.

# Risks and what comes next

### What could go wrong

- The tiles take space from popular services, so I watch total requests
- Weak requests cost pros money, so I count only requests that get quotes
- Many people start on Instagram, not on our homepage

### What comes next

- Suggest the next service after a request
- A small creator pilot: pros share "found on Armut/ProntoPro" with a link to the occasion page
- Better price and city pages for search

# In short

People already use Armut for events, around 108,000 a year, and they often need more than one service. But nothing on our homepage, search or service pages shows them what we offer.

So I'd test one page per occasion that brings our services together and sends each one into today's request form.

Small enough for a team of three, ready in weeks, and usable in every market.

# Appendix

- What I still need to check: whether low reach really explains the gap, whether people need several services as often as my samples suggest, and whether pros can handle more requests
- Where the numbers come from: Armut and ProntoPro price pages and pro pages (checked 7-8 Nov 2026), marriages from TÜİK (via DHA), the photographers' chamber via Milliyet
- The three sites seem to share one system: request numbers in a row and one account working everywhere (my inference)
- Design options: github.com/AhmetTunayCelik/Armut/blob/main/wireframe/occasion-hub-designs.html
- Full report: github.com/AhmetTunayCelik/Armut/blob/main/REPORT.md
